

Brief introduction for Tools - VTA Tool - Virtual TA :

"VTA" is a tool provided by DrayTek for local Ethernet-connected hosts or PCs to use popular CAPI-based software such as RVS-COM or BVRP etc. to access the router as a local ISDN TA for FAX sending or receiving via the ISDN line. Basically, it is a client / server network model. The Virtual TA server built into the router handles the connection establishment and release. The Virtual TA client, installed in the Ethernet-connected host, creates a CAPI-based driver to relay all CAPI messages between applications and the router's CAPI module.
